Design Overview

Architectural design

In our project there are 2 types of users: teachers and students. After registering oneself as a teacher/student and then logging in, the dashboards will be different for both teacher and the student.

The student will be able to view all the courses he has taken and upon clicking a particular course, he'll see all the details of the course like course topics and modules for that course. He'll also be able to view what percentage of that course has been completed by him. Within a module there can be reading material, videos and a quiz for that module. Upon completing a course a certificate will be generated automatically which will be shown in the student's profile.

The teacher will have the ability to register a course, break that into modules and upload/update content for each module. The teacher can view the courses he is instructing and can see the progress of his students who are taking a particular course. Both the teacher and student can view/edit their respective profiles.

System Interfaces

User Interface:

The system caters to 2 types of users: students and teachers. Students can sign up, search for a course and register for it. The student can see the list of the courses he has taken and upon clicking a course he can see the topics, modules and also his progress in that course. After completing the quizzes in each course, they'll get a certificate that they can see in their profile. The student can edit the personal details in his profile as well.

Teachers can sign up, register a course, break it into modules and upload/update the content for these modules. They can see the list of courses that they are instructing and on clicking a particular course they can see the list of students enrolled in that course and their progress.

The teacher can edit the personal details in his profile as well.

Below are the screenshots for register and login page:

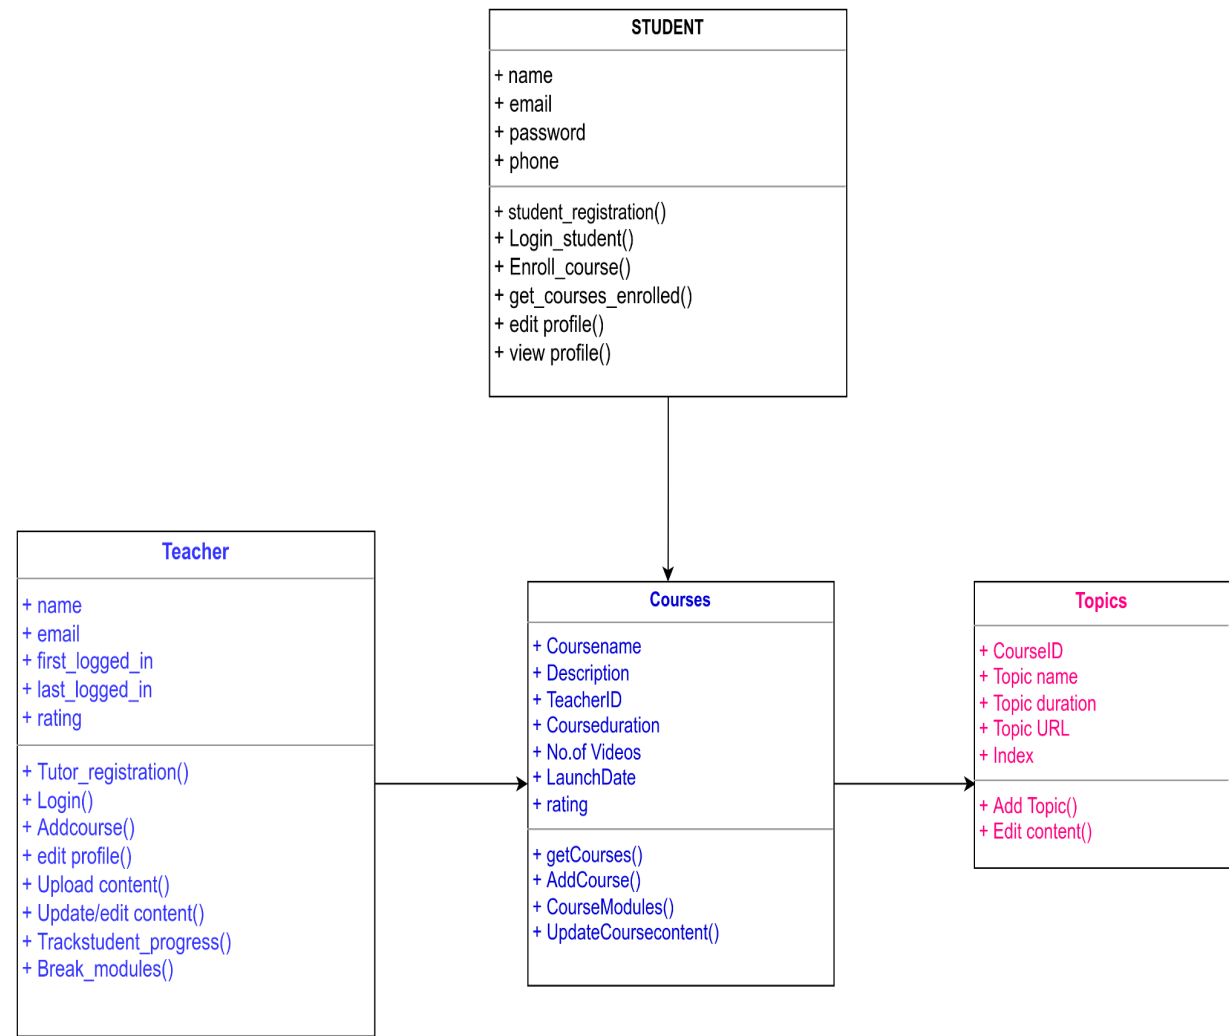

The screenshot shows a web application interface with a blue header bar containing the links "COURSES", "REGISTER", and "LOGIN". The main content area is light gray and features a white "Register" form in the center. The form includes the following fields: "Username" (placeholder: "Enter username"), "Email" (placeholder: "Email address"), "Contact Number" (placeholder: "Enter Contact number"), "Password" (placeholder: "Enter password"), and "Confirm Password" (placeholder: "Confirm password"). Below these fields is an orange "Register" button. At the bottom of the form, there is a link: "Already have an account? [Login](#)".

The screenshot shows the same web application interface with the blue header bar. The main content area is light gray and features a white "Login" form in the center. The form includes the following fields: "Email" (placeholder: "Email address") and "Password" (placeholder: "Enter password"). Above the password field, there is a link: "Forgot Password?". Below these fields is an orange "Login" button. At the bottom of the form, there is a link: "Don't have an account? [Register](#)".

Sequence Diagrams

1. For student

2. For teacher

Design Rationale

1. Initially the client proposed that the backend be built using .NET. However, due to limited object relational support, the idea was dropped and instead node js was used for backend
2. Initially the client gave the option of using either SQL or Nosql databases but due more scalability and deep query ability, mongodb was chosen over SQL.
3. At the beginning it was decided that there would be 3 types of users using the LMS portal: the students, teachers, and an admin to manage permissions. However, keeping in mind the complexity of the application and time constraints for the project, we have kept only 2 types of users: students and teachers.
